Nowadays there is a problem of formation of graduates' key competences in the Kazakhstan pedagogic. In accordance with many researchers [1; 2.], graduates of educational institutions, possessing extensive knowledge and abilities, can´t apply this knowledge and abilities practically. It concerns also a foreign language when the knowledge of aspects of language and the regional geographic facts doesn´t provide ability to understand other culture and its representatives. Insufficient mutual understanding of representatives of various cultures leads to emergence of problems in communication, and even often to rejection of other culture, exaggeration of advantages of native culture and shortcomings another. This problem can be solved by formation of cross-cultural competence of the personality.

In communicative behavior speech has no autonomous purpose; it is usually directed at achievement of extra speech tasks. Therefore, the communicative behavior is activity by means of the language which structure, certainly, includes not only knowledge of a language material, but also speech skills and abilities. Depending on what of aspects is initial, basic for definition of strategy of training in a foreign language, two approaches to training in this subject are allocated: linguistic, conditional and communicative and communicative.

Communicative approach assumes assimilation of a foreign language by means of communication. As one of key concepts of this approach in the foreign and domestic theory of foreign languages training the communicative competence is as a phenomenon reflecting abilities of the person to speech communication acts. Communicative activity is a system of consistently being developed actions, each of which is directed on the solution of a private task and can be considered as some "step" in the direction to the communication purpose.

Analysis of educational-cognitive activity showed that the most effective are searching for information, publication and electronic communication, which form the basis of Internet lesson, involving classroom and independent work of students. In computer-mediated learning environment various forms of Internet lesson teacher develops in accordance with the curriculum of the subject and the basic textbook of practical or theoretical course.

 In our study, the concept of "Internet Lesson" is used as: 1) the outline of learning activities in the form of information resources available in the learning portal of the faculty available to students on the Internet, 2) a type of educational activity (genre of a lesson) , a basis of full-time class, and 3) the module of e-course, which includes training materials (resources), communication services (forums) and automated monitoring forms (tests). Internet lesson aims to train all aspects of speech activity; however, taking into account the linguadidactic properties of the virtual environment is mostly designed for independent work of students.

The results of the study can be used for practical teaching of language and culture to students both in the philological department of higher education, as well as students of non-language specialties and correspondence school.
